

The apoptotic configuration across the MYC x OXPPOS quadrants

Verdict on the rule fixed at 688539d before any readout: MIXED
EXPLORATORY; not pre-registered. No outcome variable enters.

Standardised means from m1: readout ~ quadrant + PAM50 + purity + leukocyte fraction; the small coloured number under each point is that quadrant cell's n. SCAN-B HAS NO PURITY OR LEUKOCYTE ESTIMATE, so there m1 is quadrant + PAM50. Quadrant from the frozen STATE constructor's own MYC and OXPPOS (GSVA) calls, each cohort on its own medians. NO PRODUCTTERM is fitted, which is why no line joins the pairs. Composite and arms are E33's signed mean-z on log2(linear + 1). The two OXPPOS contrasts are near-guaranteed: the configuration's genes and signs were chosen on OXPPOS in these same cohorts, so the MYC contrasts are the informative ones. Values are cohort-relative and are NEVER compared numerically between cohorts. NOTHING HERE LICENSES ATREATMENT-SELECTION CLAIM: no cohort available carries an OXPPOS-directed or BH3-directed intervention.
