

E38 diagnostic: every composite against OXPHOS, in both tissues. GATE: NOT CANCELLATION ALONE

POST-HOC AND EXPLORATORY; this cannot overturn E36's UNINTERPRETABLE verdict. Partial Spearman, unadjusted, on the PAIRED comparator so both tissues are n = 113; 10,000 patient-level resamples. The dashed blue line is E36's unsigned floor of 0.729 (leg A); the grey band is the collapse window of +/-0.3 (leg B). Both were fixed at 94d5fd7 before any value here existed.

E38. EXPLORATORY AND POST-HOC. A DIAGNOSTIC that decomposes quantities E36 already computed; it adds no hypothesis and CANNOT OVERTURN E36'S UNINTERPRETABLE VERDICT. The luminal-only score and the compartment halves are SECONDATTEMPTS after seeing a first result and are reported beside the originals, never instead of them. The arbitrary sign splits were named gene by gene at 94d5fd7 before this ran. THE CONFIGURATION HAS NO CYTOSOLIC HALF - all six of its genes are in MitoCarta 3.0 - so the compartment panel uses E14's apoptotic machinery (44) less CYCS, whose mitochondrial half contains 5 of the 6 configuration genes and is therefore NOT a control. A mitochondrial half correlates with OXPHOS partly through shared mitochondrial content, and E14's compartment-matched null is NOT rebuilt here. TCGA-BRCA only, unreplicated; the normals are FIELD-ADJACENT tissue; the composition difference between the tissues remains enormous whatever any adjustment does. N3; no product term; no outcome variable.
